

Blocky

Business plan

October 2026 blocky.page hello@blocky.page

A money app you talk to. You say what you want to do with your money, Blocky works out how, and nothing moves until you approve it with your fingerprint.

01 Summary

What it is. Blocky is a money app with an assistant that does the work. People send, save, invest and track their money by saying what they want, like “send Sam \$20” or “buy \$50 of Apple”, and Blocky handles the rest. Underneath it runs on digital dollars (USDC) and public networks, which makes money instant, global and fully owned by the user. They never have to understand that part.

Where it's going. The friend who's good with money and can actually do things: a Blocky card it can see, a coach that helps you spend better, and an assistant that shops and pays for you, with every payment still approved by you.

Where it starts. In the Czech Republic, with 18–25-year-olds who already have some money in crypto or on an exchange and want to do more with it, but find today's wallets stressful and risky. They are casual holders, not crypto experts. Their money is already onchain, so Blocky can serve them completely today.

Why it can be trusted. The AI only translates what the user means. A separate, deterministic planner builds the actual transaction, the server checks it, and the user approves it with their fingerprint. Blocky never holds anyone's money or keys.

How it makes money. Sending money to people is free. Blocky charges 0.5% on swaps, stock purchases and moves to other networks. That's below the big crypto wallets, and the fee is always shown in dollars before the user approves.

Where it is. The app works end to end and is in a private Android beta, with a public waitlist at blocky.page.

What we need. Blocky is raising **\$50,000 in pre-seed** to cover at least the next 18 months: legal review and company setup, the founder's time, the first hire, marketing and running costs, with a buffer in case growth is slower. We're open to early investment, advice, and introductions to fintech lawyers and card partners.

02 Vision

Blocky is the friend who's good with money, and can actually do things. It sees where your money goes, helps you spend it better, and handles the boring parts for you. You just say what you want, and approve.

Blocky is a money app, not a crypto app. Stablecoins, onchain settlement and self-custody are how it works, because they let money move instantly and globally and let people truly own it. They are not what Blocky sells.

The finished product does three things

- **It sees.** You pay with a Blocky card in shops and online, and every purchase lands in the same conversation. Blocky knows where your money goes in real life, not just onchain.
- **It advises.** It catches impulse buys ("You've spent \$140 on clothes this week, and you're saving for Lisbon. Still want it?"), finds a cheaper version of the same thing, and warns you before a subscription renews or a budget runs out. It knows your goals, so the advice is about you. The coach is opt-in: it asks, it doesn't lecture.
- **It acts.** "Order six nuggets and a drink from McDonald's to my place." Blocky places the order and pays. The same goes for bills, groceries, subscriptions and bookings.

The rule that keeps today's payments safe carries over unchanged: **Blocky proposes and the user approves.** Shopping for you is one more card to approve with a fingerprint, never the AI spending on its own. That's the answer to "would you trust an AI with your card?"

How we get there

STAGE	WHAT BLOCKY ADDS	WHO IT OPENS TO
Today	Send, request and split; save in pots; invest in stocks and tokens; track spending; money moved between networks automatically.	People who already have money in crypto or on an exchange
Next	Add money from a bank or card, withdraw to a bank, and an iPhone app.	Anyone with a bank account, no crypto needed
The full picture	The Blocky card through a licensed partner, the spending coach, and Blocky shopping and paying for you.	People ready to make Blocky their main money app

Each layer also earns: the card brings a share of every purchase, shopping can bring partner commissions, and the coach is what keeps people coming back. Each step needs partners Blocky doesn't have yet (a card issuer, deposit and withdrawal providers, shops and delivery services), and payment networks are already building systems for AI agents that shop on someone's behalf.

03 Problem

Young people are starting their financial lives in a new place. Many open an exchange account before they ever open a brokerage, and digital dollars now offer instant global payments, dollar savings and access to US stocks from anywhere. But the moment they want to do more than buy and hold on one exchange, the tools are built for experts.

- **Too much machinery.** To move or use your money you have to understand chains, bridges, gas tokens, contract addresses and slippage. One wrong choice can strand or lose money.
- **Money gets stuck.** A common case: you have dollars on one network and no gas token to move them, so you can't use your own money.

- **Scams target the interface.** Copied addresses, fake tokens and lookalike addresses work because wallets show long strings that people can't check.
- **Regular money apps don't help.** Revolut, PayPal and Cash App are simple, but they hold your money and stop at their own borders and product lines.

Why I'm building this

I've invested in crypto since 2022, and moving money between networks has always felt like a horror story. Every bridge, I was afraid I'd lose my money because I wasn't sure what I was doing. I triple-checked addresses and sent small test amounts first.

When Hyperliquid launched, I wanted to buy it. It was listed on only a few exchanges I couldn't use, and buying it onchain meant moving money across networks I didn't understand. It felt like too much hassle and too much risk, so I didn't even try. Even with years of experience, I gave up.

Complexity doesn't just scare people; it makes them skip opportunities entirely. If it stopped me, it stops almost everyone just starting out. Blocky is the app I needed.

04 Solution

Blocky turns the whole thing into a conversation. The user states the goal; Blocky checks what they have, finds the cheapest way to do it, and shows a plain card: what leaves, what arrives, the fee in dollars and when it lands.

The difference is that Blocky does the work. Other apps give people more buttons and leave the figuring-out to them. Blocky picks the route, moves money between networks, adds the gas needed and explains why, checks whether a token can be sold again, and remembers how the user likes things done. The user approves one card.

What works today

- Send money to anyone by @username, contact, ENS name or address; request money and split bills.
- Move money between ten networks, including Arc, Base, Arbitrum, Ethereum and Robinhood Chain, with the gas handled automatically.
- Buy and sell tokenized US stocks and any token by contract address, with price-impact and honeypot checks.
- Savings pots with auto-save, monthly budgets, spending insights, price alerts and notifications.
- Market prices and news explained in plain words; memory of the user's preferences.

How it stays safe

- **The AI never builds the payment.** It produces a structured intent ("transfer \$500 to the contact Mike"). Fixed code resolves Mike's address, prices it and builds the transaction; the server checks it byte for byte before the phone will sign.

- **Every payment needs the user's fingerprint.** There is no server key that can move money.
- **Addresses only come from the user.** A raw address must be typed or pasted by the user, or be a saved contact. The AI can't use one it found on a web page or remembered.
- **Lookalike detection.** An address that imitates one the user knows gets a red warning with the differing characters marked.
- **Spending limits** the user sets; the AI can lower them but never raise them.
- **Open source.** The full code is public, so anyone can check these claims.

05 Where we start

Blocky is built for everyone who wants control of their money without complicated apps. It starts with one group it can serve completely today:

18–25-year-olds who already bought some crypto on an exchange like Revolut, Binance or Coinbase, and want to do more with it (buy a coin their exchange doesn't list, move money to another network, try tokenized stocks) **but are scared of making a mistake in wallets like MetaMask.**

Why this group first

- **Their money is already onchain.** They don't need the bank connection Blocky hasn't built yet, so Blocky's value is complete for them today.
- **The pain is real and frequent.** Every new coin, network or opportunity means the same stressful steps.
- **They're easy to find and talk to.** They gather in visible places and ask “how do I buy this?” questions in public.
- **They grow with Blocky.** At 18–25 they're choosing the apps they'll use for years; when Blocky adds bank deposits and a card, they're already there.

Where to find them

- Classmates, schools and university investing clubs in the Czech Republic, where the founder can meet people in person.
- Comment sections of beginner crypto and personal-finance creators on TikTok and YouTube, rather than expert crypto forums.
- The founder's own network of friends who invest.

What we've heard so far

Casual holders want it. Three classmates who already use crypto saw Blocky and said they would use it.

Experienced crypto users pushed back. Posts on crypto subreddits drew strong reactions, mostly negative and mostly about how the keys are held: Blocky uses an embedded wallet instead of a seed phrase the user writes down. That group values managing keys themselves over ease of use, so they are not who Blocky is for.

What this changes. Blocky targets casual holders, not crypto enthusiasts, and explains key safety in plain words: the key stays on the user's phone, every payment needs their fingerprint, and they can export the key at any time.

06 Market

Three trends make this the right time:

- **Stablecoins have gone mainstream.** Digital dollars are now used for payments, savings and payroll, and payment companies are building on them.
- **Stocks are moving onchain.** Tokenized US stocks let people outside the US own exposure to companies like Apple without a US broker.
- **AI can now act reliably** when it is boxed in by deterministic code, which makes a conversational money app possible for the first time.

The big market: money apps

Blocky's long-term market is the money app itself, and young people are already moving their financial lives into apps.

WHAT	FIGURE	SOURCE
Revolut retail customers, end of 2025	68.3 million	Revolut 2025 results : up 30% in a year, on \$6 billion revenue and \$2.3 billion profit
Young adults considering Revolut vs. over-60s (Germany)	15% vs 2%	YouGov BrandIndex, March 2026 : 18–29-year-olds are over seven times more likely to consider it

One money app grew to tens of millions of customers and billions in revenue within a decade, driven by young users. Blocky aims at the next step: a money app that also does the work for you.

Where we start: in numbers

WHAT	FIGURE	SOURCE
People holding crypto worldwide	742 million	Henley & Partners, Crypto Wealth Report 2026 (Sept 2026)
Digital dollars in circulation (all USD stablecoins)	\$314.5 billion	DefiLlama, 7 Oct 2026; USDC, which Blocky uses, is \$74.0 billion of it
Crypto investors in Europe	25 million	BlackRock, People & Money: Crypto in Europe 2025 : 8% of adults, from 36,730 people in 14 markets
How much more likely 18–34s hold crypto	31% vs 17%	Same BlackRock survey: 18–34-year-old investors are 82% more likely to hold crypto than investors over 35

The starting group is a large and young slice of those 25 million European crypto investors: people under 35 are the most likely to hold crypto, and they are the ones Blocky starts with.

07 Competition

WHO	WHAT THEY'RE GOOD AT	WHERE BLOCKY DIFFERS
Revolut, PayPal, Cash App	Simple, trusted, cards and bank accounts	They hold your money and are limited to their own products; Blocky is self-custody and works across open networks.
MetaMask, Phantom, Coinbase Wallet	Self-custody, huge reach in crypto	Built for people who already understand crypto. Blocky hides chains, gas and bridges, and charges 0.5% on swaps where MetaMask charges 0.875% and Phantom 0.85% .
near.com (NEAR, launched Feb 2026)	A crypto “super app” across 35+ networks with no seed phrase; AI-assisted money management, tokenized stocks and debit cards on its roadmap	The closest to Blocky's vision. Blocky is built around the conversation itself, keeps the AI away from the transaction, and starts with one focused group instead of crypto users at large.
MetaMask Agent Wallet (June 2026), Coinbase Agentic Wallets (Feb 2026)	Wallets for AI agents that trade on their own	Built for developers and autonomous agents. Blocky is for regular people, and its AI never acts alone: every payment is a card the user approves.

Many apps already put crypto, stocks and memecoins in one place. Blocky's edge is that it does the work: the simplicity of a money app, the reach and ownership of a crypto wallet, and an assistant that handles every step without being trusted with the money.

“Can't the big apps just add an AI chat?”

- **The chat is the easy part.** The hard part is the safety design: the AI never touches the transaction, addresses only come from the user, scam checks, and a fingerprint on every payment.
- **An AI that moves money is a big risk for a large company,** so they move slowly. A focused team can move faster.
- **Blocky is built for the people they serve worst:** those stuck between an exchange and an expert wallet.

Sources: [near.com launch](#), [MetaMask Agent Wallet](#). Fees as listed in each wallet's help pages, October 2026.

08 **Business model**

WHAT THE USER DOES	BLOCKY FEE
Send money to people, pay requests	Free
Pots, budgets, insights, alerts	Free
Swaps, stock and token purchases, moves to other networks	0.5%

The fee is part of the same signed transaction and goes straight to Blocky's fee wallet, so there's no separate billing. Network fees are passed through at cost and shown separately. Free sends bring people in, and the paid actions are where the value is.

What one user is worth per month

Three kinds of user, with estimated numbers. AI cost is measured from the app's own logs on Claude Haiku 5.5: about \$0.0005 for a normal message and about \$0.014 for one that searches the web for news or prices, most of which is a \$0.01 search fee. Assuming 1 message in 10 searches the web, that averages about \$0.002 a message.

PER USER, PER MONTH	LIGHT	REGULAR	INVESTOR
Messages to Blocky	30	80	150
Paid volume (swaps, stocks, moves)	\$0	\$200	\$1,000
Revenue at 0.5%	\$0.00	\$1.00	\$5.00
AI cost (about \$0.002 a message)	\$0.06	\$0.15	\$0.29
Margin	-\$0.06	+\$0.85	+\$4.71

With a mix of half light users, a third regular and the rest investors, an average user brings about **\$1.10 a month** and costs about **\$0.13 in AI**, leaving about \$0.97. Light users cost about 6 cents a month to serve and bring in friends through free sends; the users who invest carry the revenue.

With the revenue planned for later

The \$1.10 counts swap fees only. Two more sources are planned once Blocky has the partners for them: adding and withdrawing money through a licensed on-ramp partner, and a spending card. Both earn on money the user already moves, so they add revenue without new costs per user.

PER USER, PER MONTH	LIGHT	REGULAR	INVESTOR
Swap fees, as above	\$0.00	\$1.00	\$5.00
Money added or withdrawn Partner fee of 0.5%	\$50	\$200	\$500
Revenue from adding and withdrawing	\$0.25	\$1.00	\$2.50
Card spending Blocky's share $\approx$ 0.1% of spend	\$100	\$400	\$600
Revenue from the card	\$0.10	\$0.40	\$0.60
AI cost	-\$0.06	-\$0.15	-\$0.29
Margin	+\$0.29	+\$2.25	+\$7.81

With the same mix of users, the average user is worth about **\$2.25 a month instead of \$1.10**, roughly double. Light users stop costing money: the card and deposits make them profitable even if they never swap. The ramp brings in most of the extra revenue, because on-ramp partners let the wallet set its own fee: MoonPay allows 0.5–1.25% and Transak up to 5%, and 0.5% is the low end, to stay cheap for users.

The card earns less in Europe than people expect. EU law caps the fee shops pay on a debit card at 0.2% of the payment, and the card partner takes part of that, so the card matters more for keeping money in Blocky than for its own revenue. Card revenue is higher outside the EU, where these fees are not capped.

All volumes are estimates to replace with beta data. Sources: [Transak on partner fees](#), [MoonPay vs Transak](#), [EU interchange fee cap \(Adyen\)](#).

How the big wallets earn with the same model

Swap fees are how the largest self-custody wallets make their money. Phantom earned about **\$93 million in the last 12 months** ([DefiLlama](#)), and MetaMask's swaps earn roughly \$50 million a year ([Alinvest](#)). The fee model works at scale.

Their per-user averages are not a useful benchmark for Blocky. Revenue in trading products is concentrated: a small share of heavy traders moving large amounts likely pays for most of it, while most users bring in little. Blocky's \$1.10 a month is built the other way, from three kinds of ordinary user, and counts no large traders at all.

Large users come later, and are counted carefully. In an app for casual holders, the biggest balances early on will likely be \$25,000–50,000, held by about the top 1% of users. A user like that who moves \$5,000 a month through swaps and moves pays \$25 a month in fees. If 1 user in 100 does, that adds about \$0.25 to the average user's monthly revenue, on top of the \$1.10. The projection counts this only from month 18, and winning more of these users is a later goal.

More revenue later

- **Deposits, withdrawals and a card**, as estimated above, through licensed partners.
- **Partnerships** with the networks and services Blocky routes through, where they pay for volume.

These are options to test, not commitments. Each needs its own legal check.

09 Costs

What Blocky costs to keep running each month, by number of monthly active users. This is the burn rate, before any salary.

COST PER MONTH	TODAY	100 USERS	1,000 USERS	10,000 USERS
AI Claude Haiku 5.5. About \$0.13 per user a month	\$1	\$13	\$130	\$1,300
Servers and database Railway: website, API and Postgres. Hobby plan \$5, Pro plan \$20, plus usage	\$5	\$10–20	\$40–60	\$150–300
Wallet infrastructure Privy. Free up to 499 users, \$299 up to 2,499, \$499 up to 9,999, then \$2,000 plus \$0.05 per extra user	\$0	\$0	\$299	\$2,000
Blockchain data Alchemy: reading balances and transactions on all ten networks. Free up to about 375 users, then ≈ \$0.04 per user	\$0	\$0	\$25	\$385
Total	≈ \$6	≈ \$25–35	≈ \$495–515	≈ \$3,850–4,000

For comparison, at \$1.10 per user, revenue is \$110 at 100 users, \$1,100 at 1,000 and \$11,000 at 10,000.

Privy, not AI, becomes the biggest bill. It is free until 500 monthly active users, then jumps to \$299 a month, and at 10,000 users it moves to pay-as-you-go with a \$2,000 monthly base. Railway stays small at every stage. At 10,000 users, it's worth pricing Privy's Enterprise plan or our own wallet layer, and moving off Railway to cheaper servers.

One-off legal and company setup costs are not monthly and are covered in [the funding ask](#).

Railway, Privy and Alchemy prices are from their public pricing pages, October 2026 ([Railway](#), [Privy](#), [Alchemy](#)); Railway usage at each size is an estimate. Alchemy bills in compute units: 30 million a month are free, then about \$0.50 per million; Blocky uses about 80,000 per active user a month, mostly re-reading the balance while the app is open. Privy's tiers also include 50,000 wallet signatures a month. Each send or swap is a signature, so 10,000 users making 5 transactions a month reach that limit, and each signature after it costs \$0.01. AI cost per message comes from the app's own usage logs (an 8-message test on Claude Haiku 5.5, October 2026); a web search costs \$0.01 on top of tokens. Blocky does not sponsor network fees, so there's no hidden gas bill as usage grows.

10 24-month projection

How revenue grows with users, and as new revenue sources switch on. A plan to measure against, not a promise: every input is an assumption to replace with beta data.

— Revenue — Running costs (AI, servers, Privy, Alchemy)

Monthly revenue and running costs, months 1–24. The two jumps are new revenue sources starting, not sudden jumps in users.

MONTHLY, IN MONTH	3	6	9	12	18	24
Active users	50	250	750	2,000	6,000	15,000
Revenue per user	\$1.10	\$1.10	\$1.98	\$1.98	\$2.51	\$2.51
Revenue	\$55	\$275	\$1,485	\$3,960	\$15,060	\$37,650
Running costs	-\$17	-\$58	-\$447	-\$684	-\$1,644	-\$5,355
Result before salary	+\$38	+\$217	+\$1,038	+\$3,276	+\$13,416	+\$32,295

The assumptions

- **Growth:** 50 active users by month 3 from classmates and the waitlist, 250 at the public beta in month 6, 2,000 by month 12 and 15,000 by month 24. That is about 18% more users each month in the second year, a steady pace for a consumer app growing through word of mouth and content.
- **Months 1–8, \$1.10 per user:** swap fees only.
- **From month 9, \$1.98:** adding and withdrawing money through a licensed partner adds about \$0.88 per user. The partner goes live around month 6; its revenue is counted from month 9 to be cautious.
- **From month 18, \$2.51:** the card adds about \$0.28 per user, and large users start to appear: 1 user in 100 with a \$25,000–50,000 balance who moves \$5,000 a month adds \$0.25 to the average.
- **Running costs** follow the Costs section: AI at \$0.13 per user, Railway, blockchain data from Alchemy once past its free tier (about 375 users), and Privy's steps at 500, 2,500 and 10,000 users. Privy's \$2,000 base at 10,000 users is the jump in costs around month 22.

With a salary: how long the money lasts

Add a founder salary of **\$1,000 a month while still in school** (months 1–8) and **\$2,000 a month full-time** after graduation (about the Czech average wage), a **part-time growth and marketing hire at \$1,000 a month from month 12**, plus legal setup of **about \$8,700** (company registration ≈ \$700 and a fintech lawyer's review ≈ \$8,000, both estimates to confirm with quotes once funded). Months count from today; the salary is counted from month 1 to keep the estimate cautious, although the raise is planned to close around month 3:

WITH SALARIES AND LEGAL COSTS	MONTH	AMOUNT
Biggest monthly loss (the legal review)	3	-\$8,960
First month revenue covers the founder's salary too	11	+\$320
Most money spent in total, before turning positive	10	-\$17,100
Everything spent is earned back	18	+\$8,600

What it shows: if the plan goes as projected, Blocky spends about **\$17,000** before it pays its own way, including the founder's salary. The **\$50,000** raise (see [the ask](#)) covers that, pays for the first hire, covers events and travel, and leaves a buffer for slower growth or new revenue sources that come late. The hire only happens once revenue covers the founder's salary; if growth is slower, that money stays in the buffer. Even if growth is half the plan, or the deposit partner and card come late, the raise lasts until Blocky earns its money back (around month 20–22). The product itself costs almost nothing to run before 500 users, so the money goes into the founder's time and the legal work, not servers.

Most of the growth after month 12 comes from revenue sources that don't exist yet. If the deposit partner and the card slip, revenue per user stays at \$1.10 and month 24 revenue is about \$16,500 instead of \$37,650. The plan still works, just more slowly.

11 Getting users

- **Waitlist first.** Goal: 100 signups, then let people into the Android beta in waves.
- **Build in public.** Every update becomes a short demo post on X, TikTok and Reels. Blocky the mascot is made for short videos.
- **Lead with safety.** The strongest content shows what the AI can't do: scam-address detection, fingerprint on every payment, open source.
- **Communities.** Arc and Circle developer communities, and startup and side-project communities on Reddit, as feedback requests rather than ads.
- **Product Hunt on the day the public beta opens.**
- **Measure it.** Every channel gets its own link, so it's clear where users come from.

12 Legal and risks

Blocky is non-custodial software: it never holds user funds or keys, and every transaction is signed by the user on their own device. That's a deliberate design decision to stay outside custody rules. It still needs to be confirmed by a lawyer.

Questions for a fintech lawyer (Czech Republic / EU)

1. Does a non-custodial wallet app that takes a 0.5% fee on swaps need a licence under MiCA or from the Czech National Bank?
2. Are tokenized US stocks a regulated financial instrument for EU users (MiFID), and should that feature be limited by country?
3. What consumer, privacy (GDPR) and terms-of-service obligations apply to the app?
4. Which company form to set up, in which country, and when?

Main risks

RISK	HOW BLOCKY HANDLES IT
Regulation changes or a licence is required	Legal review before the beta grows; features that carry risk (stocks) can be switched off per country.
The AI misunderstands a request	The AI can't move money; every payment is a card the user checks and approves.
Scams and wrong addresses	Addresses only from the user, lookalike warnings, limits, full review for new recipients.
Dependence on providers (Anthropic, Privy, bridges)	Each sits behind its own layer in the code and can be replaced; users can export their key and leave at any time.
Trust: people are wary of AI and crypto	Open source, a plain privacy and safety page, and no custody.
Bigger players copy the idea	Speed and focus. Their size makes them slow to ship self-custody plus AI.

13 Team

Oliver Matula, founder. 19, in my final year of high school in the Czech Republic.

- **A user of the problem first.** I bought my first crypto in 2022 and have invested ever since. I know the fear of every bridge and the missed opportunities firsthand.
- **Building since 2023.** Before Blocky, I built **aroma.money**, a token launchpad on Arc that processed about \$6,000 in volume, and **hyperone**, a mobile app for trading on Hyperliquid. Neither became a business, and both taught me what it takes to ship onchain products and get people to use them.
- **Blocky, built solo.** The mobile app, the server, the payment planner across ten networks, the safety system, the website and the promo videos, built with heavy use of AI coding tools, from the first commit in September 2026 to a working beta.

Time: Blocky gets every hour outside school now, and becomes full-time after graduation in about eight months.

Next roles needed: a part-time growth and marketing hire, paid from this raise once revenue covers the founder's salary (expected around month 12); then a second engineer, paid from revenue or a later seed round once the numbers support it.

14 Milestones and the ask

WHEN	MILESTONE
Next month	100 waitlist signups; first 20 beta users holding real money; pre-seed raise started.
3 months	Raise closed; company set up and legal review started; regular weekly updates; first revenue from the 0.5% fee; retention measured.
6 months	Add money from a bank or card and withdraw to a bank, through a licensed partner; iPhone version; public beta and Product Hunt launch.
12 months	Clear numbers on users, retention and revenue per user; decide on card partnership and fundraising.

What we need

Blocky is raising **\$50,000 in pre-seed**, enough for at least 18 months, split as in the table. If the projection holds, about \$17,000 is spent before Blocky pays its own way, and the rest covers the first hire, events, travel and a buffer for slower growth. We're open to early investment, and just as much to advice and introductions: fintech lawyers in the EU, card-issuing partners, and partners for bank deposits and withdrawals.

Use of funds

WHAT IT PAYS FOR	WHY	AMOUNT
Legal review and company setup	Confirm what licences apply before growing. An estimate, to confirm with quotes from Czech fintech lawyers once funded	\$9,000
Founder's time	\$1,000 a month while in school, \$2,000 full-time after graduation, until revenue covers it (about month 11)	\$12,000
Marketing and content	Waitlist, beta and launch	\$5,000
Running costs and tools	AI, servers, Privy, app store accounts and development tools	\$3,000
Events and travel	Crypto and startup conferences, hackathons and investor meetings, plus other business costs as they come up	\$4,000
First hire	A part-time growth and marketing hire at about \$1,000 a month for about 10 months, made only once revenue covers the founder's salary (expected around month 11–12). Until then, this money stays in the buffer	\$10,000
Buffer	About 3–4 months of full-time salary if growth is slower or partners launch late	\$7,000
Total		\$50,000

Blocky · business plan, October 2026 · numbers marked as estimates will be replaced with real data as the beta grows.
